Introduction

SpaceX, a ground-breaking firm, has revolutionized the space sector by delivering Falcon 9 rocket launches for as little as 62 million dollars, compared to upwards of 165 million dollars from other suppliers. The majority of these savings can be attributed to SpaceX's brilliant idea to reuse the launch's first stage by re-landing the rocket for the following flight. The price will decrease considerably more if this method is repeated. The objective of my project, which I am working on as a data scientist for a firm that competes with SpaceX, is to build a machine learning pipeline to forecast how the first stage will land in the future. The success of this initiative will determine how much to offer SpaceX for a rocket launch. The problems included:

- Determining every element that affects how a landing turns out.
- The interrelationships between the factors and how they impact the result.
- The ideal circumstance required to raise the likelihood of a successful landing

Section 1

Methodology

Methodology

Executive Summary

- Data collection methodology:
 - Data was collected using SpaceX REST API and web scrapping from Wikipedia
- Perform data wrangling
 - Data was processed using one-hot encoding for categorical features
- Perform exploratory data analysis (EDA) using visualization and SQL
- Perform interactive visual analytics using Folium and Plotly Dash
- Perform predictive analysis using classification models
 - How to build, tune, evaluate classification models

Data Collection

The process of acquiring and analysing data on certain variables in an established system allows one to analyze outcomes and respond to pertinent inquiries. As previously stated, Wikipedia's REST API and web scraping were used to get the dataset.

The get request is used to initiate a REST API. The response content was then encoded as JSON and converted to a pandas dataframe using `json normalize ()`. The data was then cleaned, examined for missing values, and completed as necessary.

Using BeautifulSoup, we will use web scraping to retrieve launch records as HTML tables, parse the tables, and then convert the tables to a pandas dataframe for additional analysis.

Data Collection - SpaceX API

Get request for rocket launch data using API

Use json_normalize method to convert json result to dataframe

Performed data cleaning and filling the missing value

From: https://github.com/ArtificialIntelligence-Hub/Applied-Data-Science-Capstone/blob/d9782cf6a3d640a293deb64d03242d52c3c7f3f7/Data_Collection.ipynb

```
spacex_url="https://api.spacexdata.com/v4/launches/past"
```

```
response = requests.get(spacex_url)
```

```
# Use json_normalize meethod to convert the json result into a dataframe  
data = pd.json_normalize(response.json())
```

```
# Lets take a subset of our dataframe keeping only the features we want a  
nd the flight number, and date_utc.  
data = data[['rocket', 'payloads', 'launchpad', 'cores', 'flight_number',  
'date_utc']]
```

```
# We will remove rows with multiple cores because those are falcon rocket  
s with 2 extra rocket boosters and rows that have multiple payloads in a  
single rocket.  
data = data[data['cores'].map(len)==1]  
data = data[data['payloads'].map(len)==1]
```

```
# Since payloads and cores are lists of size 1 we will also extract the s  
ingle value in the list and replace the feature.  
data['cores'] = data['cores'].map(lambda x : x[0])  
data['payloads'] = data['payloads'].map(lambda x : x[0])
```

```
# We also want to convert the date_utc to a datetime datatype and then ex  
tracting the date leaving the time  
data['date'] = pd.to_datetime(data['date_utc']).dt.date
```

```
# Using the date we will restrict the dates of the launches  
data = data[data['date'] <= datetime.date(2020, 11, 13)]
```

Data Collection - Scraping

Request the Falcon9
Launch Wiki page from url

Create a BeautifulSoup
from the HTML response

Extract all column/variable
names from the HTML
header

From:
[https://github.com/ArtificialIntelligence-Hub/Applied-Data-Science-Capstone/blob/d9782cf6a3d640a293deb64d03242d52c3c7f3f7/Data Collection with Web Scraping.ipynb](https://github.com/ArtificialIntelligence-Hub/Applied-Data-Science-Capstone/blob/d9782cf6a3d640a293deb64d03242d52c3c7f3f7/Data%20Collection%20with%20Web%20Scraping.ipynb)

```
# use requests.get() method with the provided static_url
# assign the response to a object
data = requests.get(static_url).text
```

```
# Use BeautifulSoup() to create a BeautifulSoup object from a response text content
soup = BeautifulSoup(data, 'html.parser')
```

```
extracted_row = 0
#Extract each table
for table_number, table in enumerate(soup.find_all('table', "wikitable plainrowheaders collapsible")):
    # get table row
    for rows in table.find_all("tr"):
        #check to see if first table heading is as number corresponding to launch a number
        if rows.th:
            if rows.th.string:
                flight_number=rows.th.string.strip()
                flag=flight_number.isdigit()
            else:
                flag=False
```

Data Wrangling

From: https://github.com/ArtificialIntelligence-Hub/Applied-Data-Science-Capstone/blob/d9782cf6a3d640a293deb64d03242d52c3c7f3f7/Data_wrangling.ipynb

Data wrangling is the process of organising and cleaning up dirty, complex data sets to make them more accessible and usable for exploratory data analysis (EDA).

The number of launches at each site will be determined first, followed by the number and frequency of mission outcomes for each type of orbit.

We then create a landing outcome label from the outcome column. This will make it easier for further analysis, visualization, and ML. Lastly, we will export the result to a CSV.

EDA with Data Visualization

To determine the link between the variables, such as between Payload and Flight Number, we first used a scatter graph.

Launch Location and Flight Number.

Launch Location and Payload.

Orbital type and Flight Number.

Payload and type of orbit.

Scatter plots demonstrate the interdependence of qualities. Following the identification of a pattern in the graphs. It is relatively simple to identify the variables that have the most influence on the outcome of the landing.

https://github.com/ArtificialIntelligence-Hub/Applied-Data-Science-Capstone/blob/d9782cf6a3d640a293deb64d03242d52c3c7f3f7/EDA_Visulization.ipynb

EDA with Data Visualization

Once the scatter plot gives us an indication about the relationships. For further examination, we will then employ additional visualisation tools like bar graphs and line graphs.

One of the simplest ways to understand how the qualities relate to one another is through bar graphs. The bar graph will be used in this situation to show which orbits have the best chance of succeeding.

We then employ the line graph to demonstrate a pattern or trend of the attribute across time, in this case, the yearly trend of launch success. Then, by creating dummy variables to correspond to category columns, we employ feature engineering to be used in success prediction in the future module.

https://github.com/ArtificialIntelligence-Hub/Applied-Data-Science-Capstone/blob/d9782cf6a3d640a293deb64d03242d52c3c7f3f7/EDA_Visulization.ipynb

EDA with SQL

We had run numerous SQL queries to better understand the dataset, such as

- Showing the names of the launch sites.
- Displaying 5 records for launch sites where the first letter is "CCA".
- Showing the entire weight of the payload carried by the NASA-launched booster (CRS).showing the average payload weight that the booster version F9 v1.1 can carry.
- Including the time that the first ground pad successful landing occurred.The names of the rockets with drone ship success and payload masses greater than 4000 but lower than 6000 are listed.
- Counting the total number of mission successes and failures.The names of the rocket models with the largest payload mass are included.
- Listing the failed landing_outcomes in drone ship, their booster versions, and launch sites names for in year 2015.
- Rank the count of landing outcomes or success between the date 2010-06-04 and 2017-03-20, in descending order.

Build an Interactive Map with Folium

To visualize the launch data into an interactive map. We took the latitude and longitude coordinates at each launch site and added a circle marker around each launch site with a label of the name of the launch site.

We then assigned the dataframe `launch_outcomes(failure,success)` to classes 0 and 1 with **Red** and **Green** markers on the map in `MarkerCluster()`.

We then used the Haversine's formula to calculate the distance of the launch sites to various landmarks to find answers to the questions of:

- How close the launch sites with railways, highways and coastlines?
- How close the launch sites with nearby cities?

From: https://github.com/ArtificialIntelligence-Hub/Applied-Data-Science-Capstone/blob/d9782cf6a3d640a293deb64d03242d52c3c7f3f7/Interactive_Visual_Analytics_with_Folium.ipynb

Build a Dashboard with Plotly Dash

- We built an interactive dashboard with Plotly dash which allowing the user to play around with the data as they need.
- We plotted pie charts showing the total launches by a certain sites.
- We then plotted scatter graph showing the relationship with Outcome and Payload Mass (Kg) for the different booster version.

The link of the app.py:: https://github.com/ArtificialIntelligence-Hub/Applied-Data-Science-Capstone/blob/d9782cf6a3d640a293deb64d03242d52c3c7f3f7/spacex_dash_app.py

Predictive Analysis (Classification)

Building the Model

- Load the dataset into NumPy and Pandas
- Transform the data and then split into training and test datasets
- Decide which type of ML to use
- set the parameters and algorithms to GridSearchCV and fit it to dataset.

Evaluating the Model

- Check the accuracy for each model
- Get tuned hyperparameters for each type of algorithms.
- plot the confusion matrix.

Improving the Model

- Use Feature Engineering and Algorithm Tuning

Find the Best Model

- The model with the best accuracy score will be the best performing model.

From:

https://github.com/ArtificialIntel-ligence-Hub/Applied-Data-Science-Capstone/blob/d9782cf6a3d640a293deb64d03242d52c3c7f3f7/spacex_dash_app.py

Results

The results will be categorized to 3 main results which is:

- Exploratory data analysis results
- Interactive analytics demo in screenshots
- Predictive analysis results

The background of the slide is an abstract composition. It features a dark blue field on the left side, which transitions into a complex pattern of diagonal streaks in shades of blue, red, and cyan on the right. These streaks have a textured, almost woven appearance, suggesting a digital or data-driven theme. A faint grid pattern is also visible, particularly in the lower right quadrant.

Section 2

Insights drawn from EDA

Flight Number vs. Launch Site

This scatter plot shows that the larger the flights amount of the launch site, the greater the success rate will be.

However, site CCAFS SLC40 shows the least pattern of this.

Payload vs. Launch Site

This scatter plot shows once the payload mass is greater than 7000kg, the probability of the success rate will be highly increased.

However, there is no clear pattern to say the launch site is dependent to the payload mass for the success rate.

Success Rate vs. Orbit Type

This figure depicted the possibility of the orbits to influences the landing outcomes as some orbits has 100% success rate such as SSO, HEO, GEO AND ES-L1 while SO orbit produced 0% rate of success.

However, deeper analysis show that some of this orbits has only 1 occurrence such as GEO, SO, HEO and ES-L1 which mean this data need more dataset to see pattern or trend before we draw any conclusion.

Flight Number vs. Orbit Type

This scatter plot shows that generally, the larger the flight number on each orbits, the greater the success rate (especially LEO orbit) except for GTO orbit which depicts no relationship between both attributes.

Orbit that only has 1 occurrence should also be excluded from above statement as it's needed more dataset.

Payload vs. Orbit Type

Heavier payload has positive impact on LEO, ISS and PO orbit. However, it has negative impact on MEO and VLEO orbit.

GTO orbit seem to depict no relation between the attributes.

Meanwhile, again, SO, GEO and HEO orbit need more dataset to see any pattern or trend.

Launch Success Yearly Trend

This figures clearly depicted and increasing trend from the year 2013 until 2020.

If this trend continue for the next year onward. The success rate will steadily increase until reaching 1/100% success rate.

All Launch Site Names

We used the key word **DISTINCT** to show only unique launch sites from the SpaceX data.

In [5]:

```
%sql SELECT DISTINCT LAUNCH_SITE as "Launch_Sites" FROM SPACEX;
```

```
* ibm_db_sa://zpw86771:***@fbd88901-ebdb-4a4f-a32e-9822b9fb237b.clogj3

F9 v1.1 B1015	CCAFS LC-40

Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

```
%sql SELECT LANDING__OUTCOME as "Landing Outcome", COUNT(LANDING__OUTCOME) AS "Total Count" FROM SPACEX \
WHERE DATE BETWEEN '2010-06-04' AND '2017-03-20' \
GROUP BY LANDING__OUTCOME \
ORDER BY COUNT(LANDING__OUTCOME) DESC ;
```

```
* ibm_db_sa://zpw86771:***@fbd88901-ebdb-4a4f-a32e-9822b9fb237b.clogj3sd0tgtu0lqde00.databases.appdomain.c
loud:32731/bludb
Done.
```

Landing Outcome	Total Count
No attempt	10
Failure (drone ship)	5
Success (drone ship)	5
Controlled (ocean)	3
Success (ground pad)	3
Failure (parachute)	2
Uncontrolled (ocean)	2
Precluded (drone ship)	1

We selected Landing outcomes and the **COUNT** of landing outcomes from the data and used the **WHERE** clause to filter for landing outcomes **BETWEEN** 2010-06-04 to 2010-03-20.

We applied the **GROUP BY** clause to group the landing outcomes and the **ORDER BY** clause to order the grouped landing outcome in descending order.

A satellite view of Earth from space, showing the curvature of the planet and city lights at night. The image is dark blue with a thin white line representing the horizon. The city lights are visible as bright yellow and orange spots, primarily concentrated in the lower right quadrant of the image.

Section 3

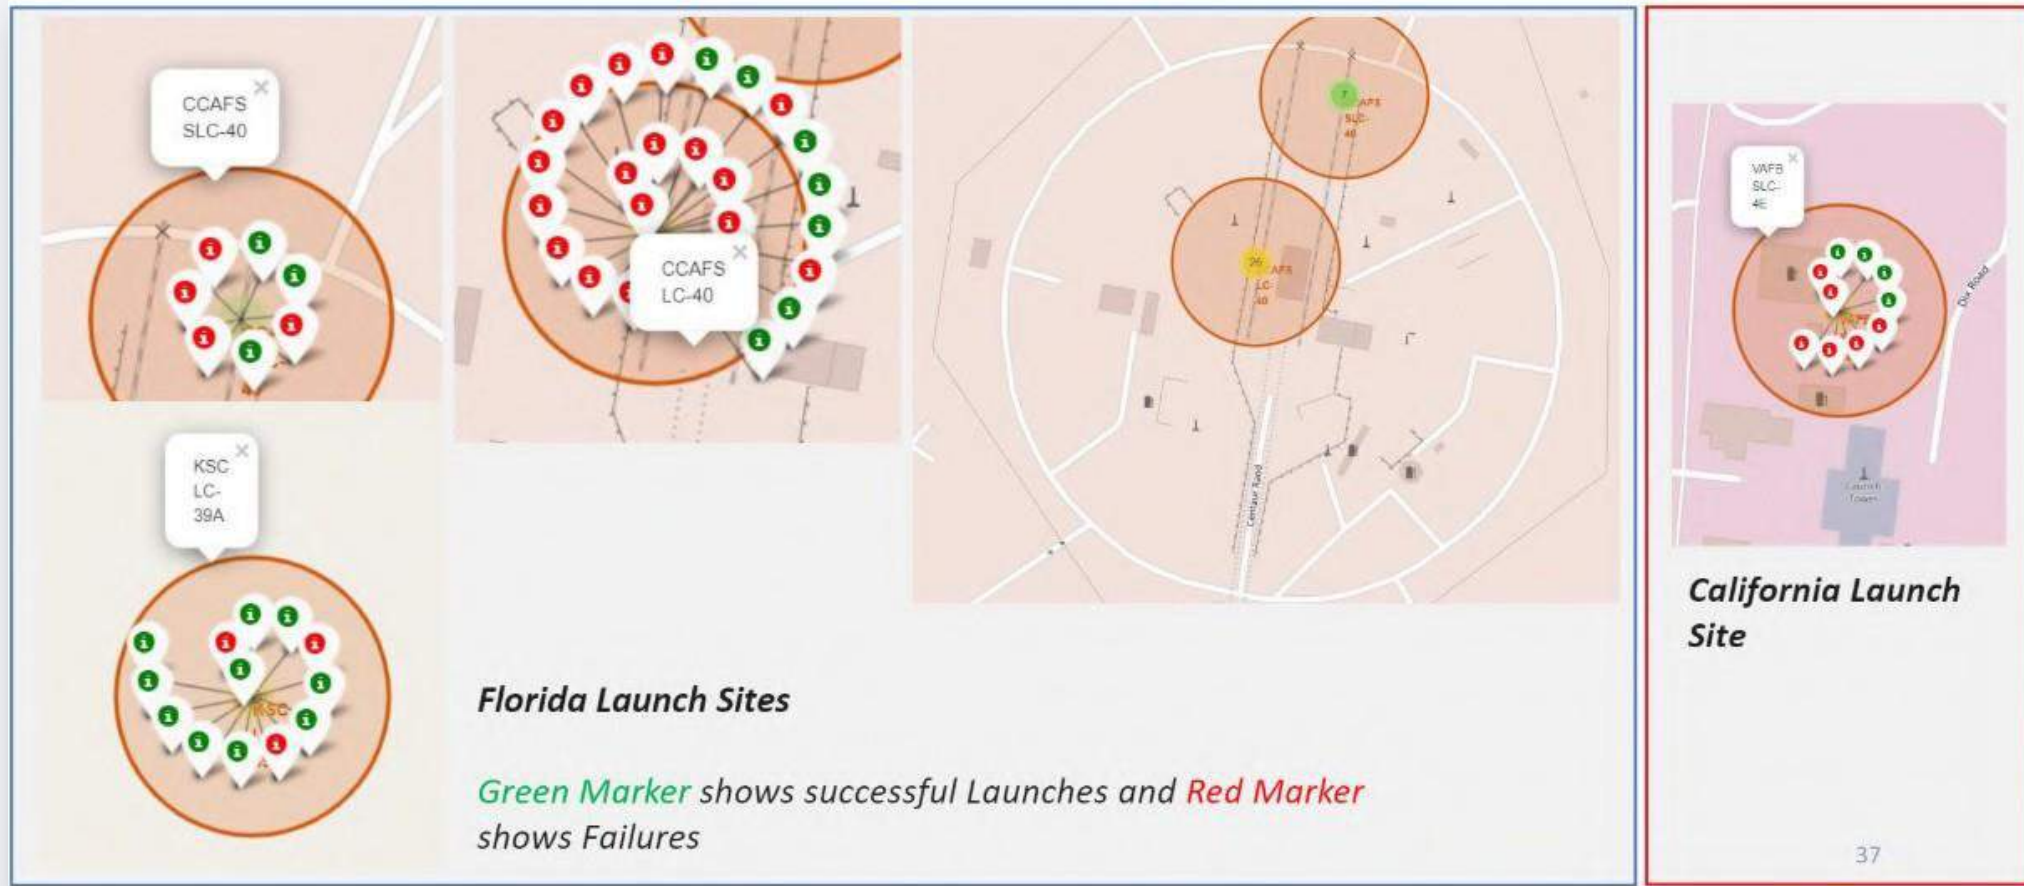

Launch Sites Proximities Analysis

Location of all the Launch Sites

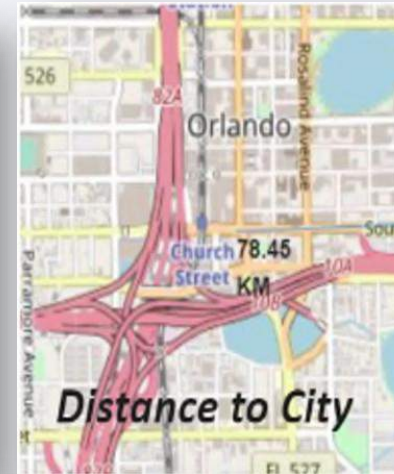

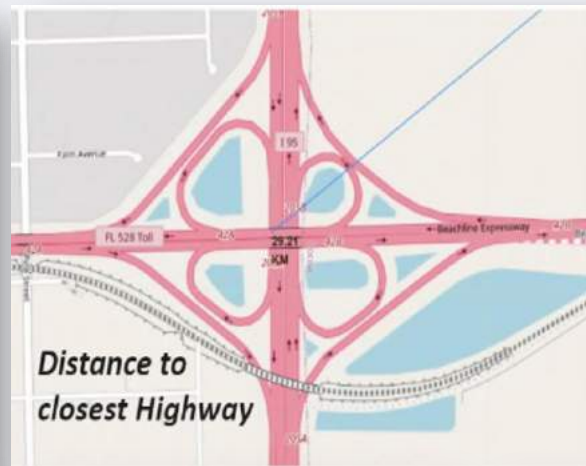

We can see that all the SpaceX launch sites are located inside the United States

Markers showing launch sites with color labels

Launch Sites Distance to Landmarks

- Are launch sites in close proximity to railways? No
- Are launch sites in close proximity to highways? No
- Are launch sites in close proximity to coastline? Yes
- Do launch sites keep certain distance away from cities? Yes

Section 4

Build a Dashboard with Plotly Dash

The success percentage by each sites.

We can see that KSC LC-39A had the most successful launches from all the sites

The highest launch-success ratio: KSC LC-39A

KSC LC-39A achieved a 76.9% success rate while getting a 23.1% failure rate

Payload vs Launch Outcome Scatter Plot

We can see that all the success rate for low weighted payload is higher than heavy weighted payload

Section 5

Predictive Analysis (Classification)

Classification Accuracy

As we can see, by using the code as below: we could identify that the best algorithm to be the Tree Algorithm which have the highest classification accuracy.

```
algorithms = {'KNN':knn_cv.best_score_, 'Tree':tree_cv.best_score_, 'LogisticRegression':logreg_cv.best_score_}
bestalgorithm = max(algorithms, key=algorithms.get)
print('Best Algorithm is',bestalgorithm,'with a score of',algorithms[bestalgorithm])
if bestalgorithm == 'Tree':
    print('Best Params is :',tree_cv.best_params_)
if bestalgorithm == 'KNN':
    print('Best Params is :',knn_cv.best_params_)
if bestalgorithm == 'LogisticRegression':
    print('Best Params is :',logreg_cv.best_params_)
```

Best Algorithm is Tree with a score of 0.9017857142857142

Best Params is : {'criterion': 'entropy', 'max_depth': 10, 'max_features': 'auto', 'min_samples_leaf': 2, 'min_samples_split': 10, 'splitter': 'random'}

Confusion Matrix

The confusion matrix for the decision tree classifier shows that the classifier can distinguish between the different classes. The major problem is the false positives .i.e., unsuccessful landing marked as successful landing by the classifier.

Conclusions

We can conclude that:

- The Tree Classifier Algorithm is the best Machine Learning approach for this dataset.
- The low weighted payloads (which define as 4000kg and below) performed better than the heavy weighted payloads.
- Starting from the year 2013, the success rate for SpaceX launches is increased, directly proportional time in years to 2020, which it will eventually perfect the launches in the future.
- KSC LC-39A have the most successful launches of any sites; 76.9%
- SSOorbit have the most success rate; 100% and more than 1 occurrence.

Thank you!
